The method comprises effecting simultaneous presentation of cytotoxic T lymphocyte (CTL) epitope and/or B-cell epitope derived from IgE, and T helper cell epitope (TH epitope) which is foreign to the animal, by antigen presenting cells (APCs) of the animal's immune system. The epitopes of the invention may be used as a vaccine against allergic diseases. The method of the invention is useful for inducing an immune response against autologous IgE in an animal, which is useful for downregulating autologous IgE in an animal, which is useful in the prevention and treatment of allergic diseases such as anaphylaxis, allergic the human IgE heavy chain C1-C2-C3-C4 domains used to create the epitopes of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   δÃ
        The present sequence is that of the human IgE epsilon chain constant region. The invention is based on the discovery that a polypeptide that includes the CHI (i.e. constant domain I in the heavy chain) and/or CH4 domain(s) of an IgE molecule, coupled to a carrier, can be used to induce in a mammal the production of antibodies that specifically bind to IgE of the mammal. Compositions are provided for inducing self-specific anti-IgE antibodies. These contain carriers foreign to the immunised mammal coupled to polypeptides containing fragments of the IgE molecule, especially fragments including the constant CH1 and/or CH4 domain, but not the CH3 domain. CH1 polypeptides have at least 95% identity to amino acids 1-110, 105, 5-105 or 5-95 of the present sequence, while CH4 nolypoptides have at least 95% identity.
                                                                                                                                                                                                                       Composition for treating immunoglobulin (Ig) E-mediated disorder such as anaphylactic shock, allergic rhinitis and conjunctivitis, comprises a polypeptide that includes CHI and/or CH4 domains of IgE molecule coupled to a carrier
while CH4 polypeptides
                                                                                                                                                                                                                                                                                              WPI;

The anti-IqE antibodies reduce or eliminate the pool of free IgE in the mammal's serum. Alternatively, a polynucleotide encoding a fusion protein comprising the carrier and IgE-derived polypeptide is administered. The compositions and polynucleotides are used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                administered. The compositions and polynucleotides are used to inhibit or treat IgE-mediated disorders such as anaphylactic shock, allergic rhinitis or conjunctivitis, an allergic reaction an allergen such as fur, dust or food, an asthmatic reaction,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 eczema or urticaria (all claimed).

reducing infection by human rhinovirus (HRV) and hence the initiation or spread of the common cold by HRV. The immunoadhesin binds to HRV and reduces its infectivity, competing with cell surface ICAM-1 for binding sites, interfering with virus entry or uncoating and directing premature release of viral RNA and formation of empty capsids. Expression of the immunoadhesin having multiple binding sites have a higher effective affinity for the virus, thereby increasing the effectiveness of the immunoadhesin. Association of secretory component and immunoglobulin J chain increases the stability of the immunoadhesin in the mucosal environment. Production is significantly less expensive in plants than in animal cell culture and production in plants is safer for human use, since plants are not known to harbor any animal viruses. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an immunoadhesin comprising:
(a) a chimeric intercellular adhesion molecule (ICAM)-1 comprisin rhinovirus receptor protein linked to at least a portion of an immunoglobulin heavy chain; and (b) optionally a J chain and secretory component associated with chimeric ICAM-1 molecule. The immunoadhesin has plant-specific
                                                                             since plants are not known sequence is that of a human the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      glycosylation and virucide activity. The immunoadhesin is useful for reducing infection by human rhinovirus (HRV) and hence the initiation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Disclosure; Fig 7; 138pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to a novel method for inducing an immune response cagainst autologous immunoglobulin E [Ig] in an animal. The method comprises effecting simultaneous presentation of cytotoxic T lymphocyte (CTI) epitope and/or B-cell epitope derived from IgE, and T helper cell cepitope (TH epitope) which is foreign to the animal, by antigen presenting cells (APCs) or the animal's immune system. The epitopes of the invention may be used as a vaccine against allergic diseases. The method of the invention is useful for inducing an immune response against autologous IgE in an animal, which is useful for downregulating cutologous IgE in the animal. This method is useful in the prevention and treatment of allergic diseases such as anaphylaxis, allergic crininitis, asthma and atopic dermatitis. The present sequence represents the human IgE heavy chain C1-C3-C4 domains fused to the MIGIS CC fragment used to create the epitopes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Catalytic antibodies which cleave specific target sequences in the IgE heavy chain constant region are exemplified. Cleavage is targetted so as to separate the Fab (antigen binding region) from the Fc region (contg. FcR binding site for attachment to the IgE receptor on mast cells), thereby destroying receptor binding activity. The target peptides were selected after consideration of their primary and secondary structure. The antibodies can be used to block
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Selecting catalytic antibodies which cleave target peptide - to block allergic reactions or as preventive treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Davis CG,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         20
                   This invention relates to a novel method for inducing an immune resagainst autologous immunoglobulin E (IgE) in an animal. The method comprises effecting simultaneous presentation of cytotoxic T lymphc (CTL) epitope and/or B-cell epitope derived from IgE, and T helper epitope (TH epitope) which is foreign to the animal, by antigen

The method of the invention is useful for inducing an immune response against autologous IgE in an animal, which is useful for downregulating autologous IgE in the animal. This method is useful in the prevention and treatment of allergic diseases such as anaphylaxis, allergic rhinitis, asthma and atopic dermatitis. The present sequence represents the human IgE heavy chain C2-C3-C4 domains used to create the epitopes of the invention.

                                                                                                                                                                                                                                                                                                             В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention relates to a novel method for inducing an immune response capainst autologous immunoglobulin E (IgB) in an animal. The method comprises effecting simultaneous presentation of cytotoxic T lymphocyte (CTL) epitope and/or B-cell epitope derived from IgE, and T helper cell epitope (TH epitope) which is foreign to the animal, by antigen presenting cells (APCS) of the animal's immune system. The epitopes of the invention may be used as a vaccine against allergic diseases. The method of the invention is useful for inducing an immune response against autologous IgE in an animal, which is useful for downregulating autologous IgE in the animal. This method is useful in the prevention and treatment of allergic diseases such as anaphylaxis, allergic rhinitis, asthma and atopic dermatitis. The present sequence represents the human IgE heavy chain C2-C3-C4 domains optimised for expression in a manmalian system, this sequence was used to create the epitopes of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

The method comprises effecting simultaneous presentation of cytotoxic T lymphocyte (CTL) epitope and/or B-cell epitope derived from IgE, and T helper cell epitope (TH epitope) which is foreign to the animal, by antigen presenting cells (APCs) of the animal's immune system. The epitopes of the invention may be used as a vaccine against allergic diseases. The method of the invention is useful for inducing an immune response against autologous IgE in an animal, which is useful for downregulating autologous IgE in an animal, which is useful for downregulating and treatment of allergic diseases such as anaphylaxis, allergic rhinitis, asthma and atopic dermatitis. The present sequence represents the human IgE heavy chain C2-C3-C4 domains optimised for expression in an E. Coli system, this sequence was used to create the epitopes of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Inducing im animal, by lymphocyte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI;

cc 266BL cDNA library screened with a probe corresp. to the N-terminus of CC 19E. The region encoding amino acids 218-547 was cloned into the vector cc pwT311 under control of the tryptophan promoter. The resultant protein CC replacing their coding sequence with a bicistronic linker. The resultant CC construct encodes the Fc(epsilon) constant heavy region from amino acids CC 226-547. When it is expressed in E.coli, the protein produced is a CC qlycosylation unmasks new antigenic sites thus rendering the Fc fragment immunogenic and able to induce antibodies that recognise native IgE but CC in anti-allergenic vaccines to modulate the fragments complexes. The Fc fragments can he nearly constant the constitution constant heavy region from anion acids cc 10 do not form histamine-releasing complexes. The Fc fragments can he nearly constitution in anti-allergenic vaccines to modulate that recognise native IgE but C mediated he recognise can be nearly complexes.
                                                                                                                                                                                                                                                                                                                   밁

The sequence is preferably mutated (see AAR75225) to represent a protein encoding a protein where Cys225 is mutated, optionally together with Val224, Ser226 and Arg227. The protein is useful in the study and treatment of allergy.
                                                                                                                                                                                                                                                                                                                                                       11-MAY-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is an immunogenic peptide consisting of the heavy chain constant regions 2, 3 and 4 of the human IgE. It was used to construct a number of immunogenic peptides which consisted of regions of IgE from different mammals, which appear to cause a stronger polyclonal anti-self IgE response than peptides consisting of the same regions from one mammal. Immunogenic peptides, particularly those consisting of different heavy chain constant regions, can be used for vaccination in humans, against bacterial and viral infections and allergies, such as asthma, fur, pollen and food allergies and eczema.

                                                                                                                                                                                                                                                                                                                                                                                                       δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes immunoglobulin E (IgE)-CH3 domain CC antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic CC and anti-asthmatic properties. (I) induces polyclonal antibodies Specific for a target effector site on the ppsilon-heavy chain of IgE, CC and so preventing triggering and activation of mast cells and basophils CC and downregulation of IgE synthesis. Conjugates, or fusion peptides, CC containing (I) are used for active immunisation against IgE-mediated CC allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy CC dermatitis. Nucleic acids that encode these compounds are useful for CC recombinant production of corresponding peptides or in DNA vaccines. CC Conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell CC constraints (disulfide bridge) to stabilise conformational features and CC maximize cross-reactivity to the natural target. They induce safe CC (non-anaphylactogenic) antibodies. AAY79994 to AAY80084 represent amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match 55.6%;

Sequence 45, Application US/10047542

Patent No. US20020168367A1

GENERAL INFORMATION:
APPLICANT: LARRICK, JAMES W.
APPLICANT: WYCOFF, KEITH L.

TITLE OF INVENTION: NOVEL IMMUNOADHESINS FOR TREATING AND PREVENTING VIRA

TITLE OF INVENTION: AND BACTERIAL DISEASES

FILE REFERENCE: 030905.0004.CIP1

CURRENT APPLICATION NUMBER: US/10/047,542

CURRENT FILING DATE: 2001-10-26

PRIOR APPLICATION NUMBER: PCT/US01/13932

PRIOR APPLICATION NUMBER: PCT/US01/13932

PRIOR APPLICATION NUMBER: DOS-04-28

PRIOR APPLICATION NUMBER: DOS-04-28

PRIOR FILING DATE: 2000-04-28

PRIOR FILING DATE: 2000-04-28

PRIOR FILING DATE: 2000-04-28

PRIOR ELING DATE: 2000-04-28

PRIOR ELING DATE: 2000-04-28

PRIOR ELING DATE: 2000-04-28

PRIOR PILING DATE: 2000-04-28

Patent No. US2020168367A1

GENERAL INFORMATION:
APPLICANT: LARRICK, JAMES W.
APPLICANT: WYCOFF, KEITH L.

APPLICANT: MYCOFF, KEITH L.

TITLE OF INVENTION: NOVEL IMMUNOADHESINS FOR TREATING ANT TITLE OF INVENTION: AND BACTERIAL DISEASES

FILE REFERENCE: 030905.0004.CIP1

CURRENT APPLICATION NUMBER: US/10/047,542

CURRENT FILING DATE: 2001-10-26

CURRENT FILING DATE: 2001-10-26
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            APPLICANT: Saxon, Andrew

Sequence 2, Application US/09949375A
Patent No. US20020172673A1
GENERAL INFORMATION:
APPLICANT: KLYSNER, Steen et al.
TITLE OF INVENTION: METHOD FOR DOWN-REGULATING IG:
FILE REFERENCE: 3631-0111P
CURRENT APPLICATION NUMBER: US/09/949,375A
CURRENT FILING DATE: 2002-01-18
NUMBER OF SEQ ID NOS: 38
SOFTWARE: Patentin version 3.1
SEQ ID NO 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    GENERAL INFORMATION:
